What happens when you vary the size of the Hash table?

As the size of the hash table increases its load factor decreases.

What happens when you vary the size of the Bloom filter?

As the size of the bloom table increases its load factor decreases

Do you really need the move to front rule?

Yes, running the program on the bible without the move to front rule gave an average seek length of about 912. With the move to front rule that average becomes 53. This is substantial speedup which is noticeable while waiting for the program to execute.
